

For my Generative AI image, I used Adobe Firefly – a free text-to-image generator. I used this particular program because I've used it before in other classes and its results are often what I expect them to be. You're also able to tailor it to a pretty specific degree, which is nice. I needed a square image of a bird's-eye view of a pixelated field, and after a few reloads, I got what I needed. My project is based on Pokemon, with Team Rocket chasing Ash's Pikachu around a grassy pixel field.
